![THERMO KING]

INCREASE FLEET EFFICIENCY
WITH DATA SHARING

Our Connected Solutions can integrate temperature, unit alarms, trailer locations, unit settings and much more into transport management systems, giving customers the ability to monitor critical cargo through the dispatch process from pickup through delivery. Thermo King has partnered with multiple fleet management and asset maintenance software companies, as well as various customer IT departments, to enable seamless data sharing. Depending on the system, TracKing enables the generation of temperature, fuel, door opening and reefer alarm notifications within the fleet management system. It also integrates unit engine hours and alarms into asset maintenance systems, creating maintenance schedules and populating service tickets.
